

Model

isHollow(String fieldName)

Returns whether the named field is hollow.

isClean(String fieldName)

Returns whether the named field is clean. New fields are not clean.

setClean(String ... fieldNames)

Marks named fields "clean", causing them to not be written on push unless changed again after this invocation. Cleans all if no names provided.

setDirty(String ... fieldNames)

Artificially marks named fields "dirty", forcing a write on push regardless of value. Dirty state cleared by push/pull. Dirties all if no names provided.

clear(String ... fieldNames)

Resets named fields to default values, which is null for scalar fields and an empty list for vectors. Clears all if no arguments.
